

TestAutothon 2026

Event Details

Total Challenge Duration: 5 hours

Time: 10:00 AM–3:00 PM IST

Submission Deadline: All deliverables must be submitted by **2:59 PM IST**.

Required Deliverables

Each team must submit:

1. Automation framework and execution report using GitHub repository link.

Repository Naming Convention:

TeamName-TestAutothon26-AutomationFramework

You are free to use any automation framework or programming language. Make sure if you are using proprietary framework which cannot be uploaded on GitHub you inform the judges/organizers at the start of the hackathon.

2. Test strategy document and bug report to the respective team folders in the google drive link provided.

Google Drive URL has been emailed to you by Team STeP_IN. If you have not received it, please contact the volunteers for help.

Document Naming Convention:

TeamName_TestAutothon26_TestStrategy

TeamName_TestAutothon26_BugReport

Format: Can be Word, PDF or Excel

Late or incomplete submissions may not be considered for evaluation. Both Submissions are mandatory

Challenge Tracks and Prizes

Automation Quest

The Automation Quest will have two winning teams. Automation frameworks will be evaluated by the **STeP-IN judging panel**.

- **Winner:** ₹1,00,000
- **Runner-up:** ₹70,000

The top eight teams will be selected by the judges on Day1 and invited for the next evaluation round on Day 2.

Bug Quest

The Bug Quest will have three winning teams. Test strategies and bug reports will be evaluated by the **Gajab team**.

- **Winner:** ₹15,000
- **Runner-up:** ₹12,500
- **Second Runner-up:** ₹10,000

Double-Win Opportunity

Teams should mandatorily participate in both tracks and are eligible to win prizes in both the **Automation Quest** and the **Bug Quest** separately

General Challenge Instructions

Your team has two challenges to tackle:

1. Build a robust automation framework for the application under test.
2. Create a comprehensive test strategy and identify meaningful product defects.

You may divide your team into smaller groups and work on both challenges in parallel. How you organize your team and allocate your time is entirely up to you.

As a general recommendation, teams may consider spending approximately:

- Three hours on the Automation Quest
- Two hours on the Bug Quest

This is only a recommendation. Teams are free to follow any strategy they believe will produce the strongest submission.

Use of AI

The use of AI is strongly encouraged throughout the TestAutothon.

Teams should use AI wherever it can meaningfully accelerate planning, development, execution, analysis, or reporting. AI may be used to:

- Generate or improve the test strategy
- Identify test scenarios and edge cases
- Design the automation framework
- Generate or refactor automation code
- Create test data
- Diagnose test failures
- Build self-healing automation capabilities
- Perform accessibility, security, performance, or visual analysis
- Summarize test results
- Generate dashboards and execution insights
- Analyze defects and estimate business impact
- Improve bug descriptions and reproduction steps
- Generate product recommendations

AI usage alone will not guarantee additional points. Judges will evaluate how appropriately, effectively, and responsibly AI has been incorporated.

Teams must understand, review, validate, and be able to explain all AI-generated work to the judges. Submissions containing unverified or non-functional AI-generated content may lose points.

AI Usage Report

Teams must disclose to the judges:

- AI tools and models used
- The tasks for which AI was used
- Important prompts or prompt sequences
- AI-generated outputs incorporated into the submission
- How those outputs were reviewed or validated
- Errors, limitations, or hallucinations identified
- Time saved or improvements achieved through AI

Reminder: Teams should never include passwords, OTPs, personal data, credentials, proprietary information, or other sensitive data in public AI tools or submitted prompts.

Challenge 1: Automation Quest

Application Under Test

Gajab India's Bargain Bazar

<https://stg.gajab.com/>

(Please do not use production URL for testing/hackathon)

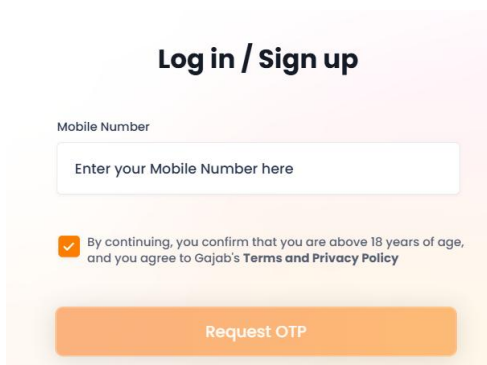

Business Workflow to Automate

Automate the following end-to-end customer journey:

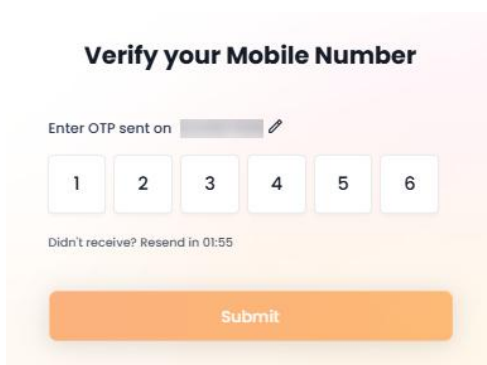

1. Navigate to Gajab website.
2. Click on Log in or sign-up button.

3. Enter Mobile number and request an OTP.

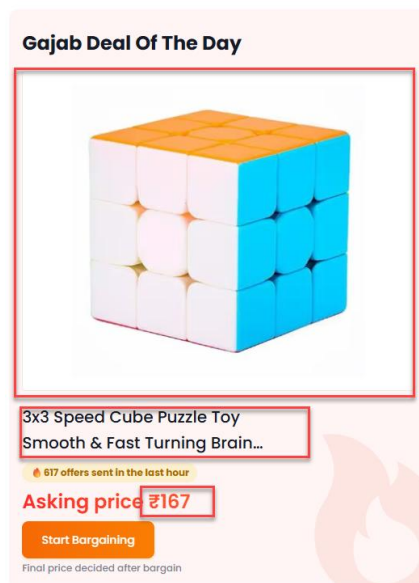

4. Enter the **Default OTP – 123456** and click on submit. Verify the login successful message.

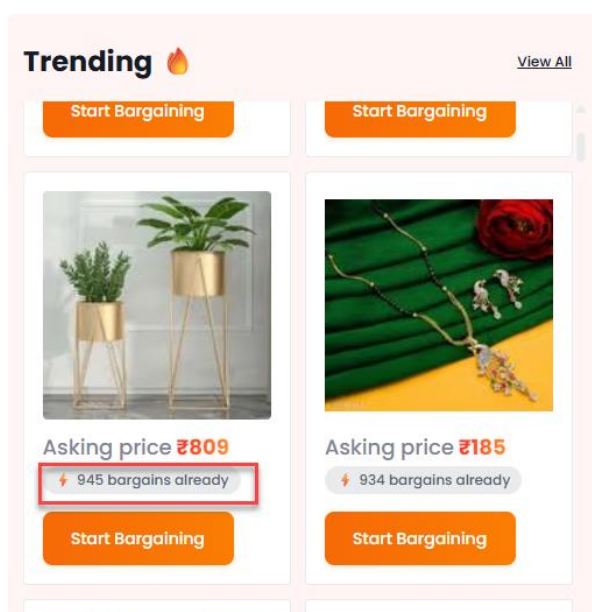

- Enter the Pin code and make sure it is reflected upon selection.

- Capture the **Gajab Deal of the Day**.

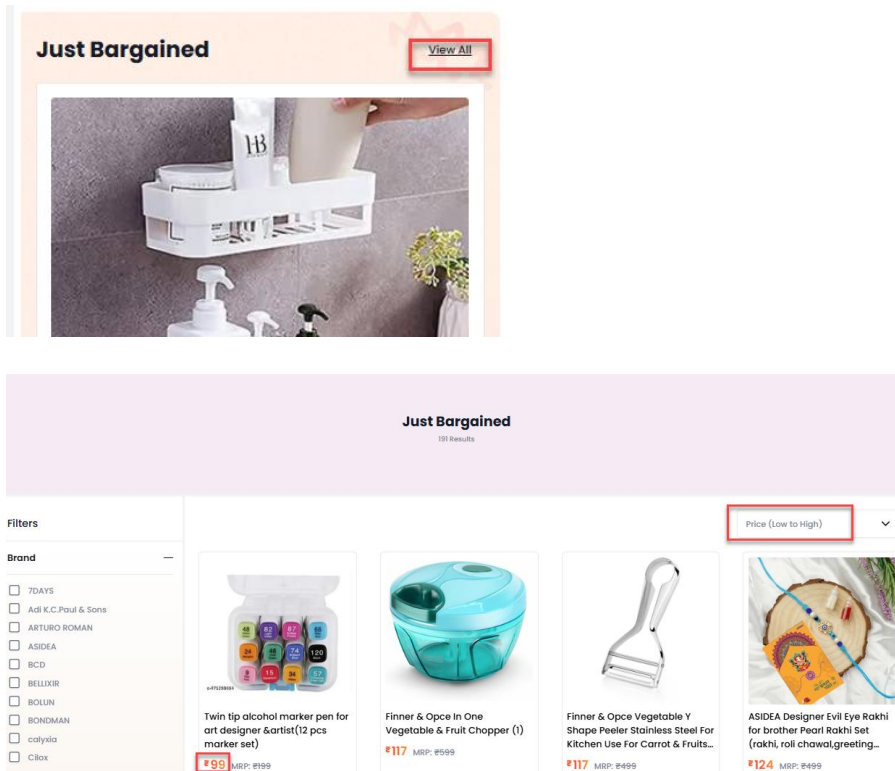

- Email the product image, product name, and asking price to your email address.
- Identify the most-bargained product under **Trending Products**. (If there are two products with the same bargains. Pick the one occurring first in the scroll.)

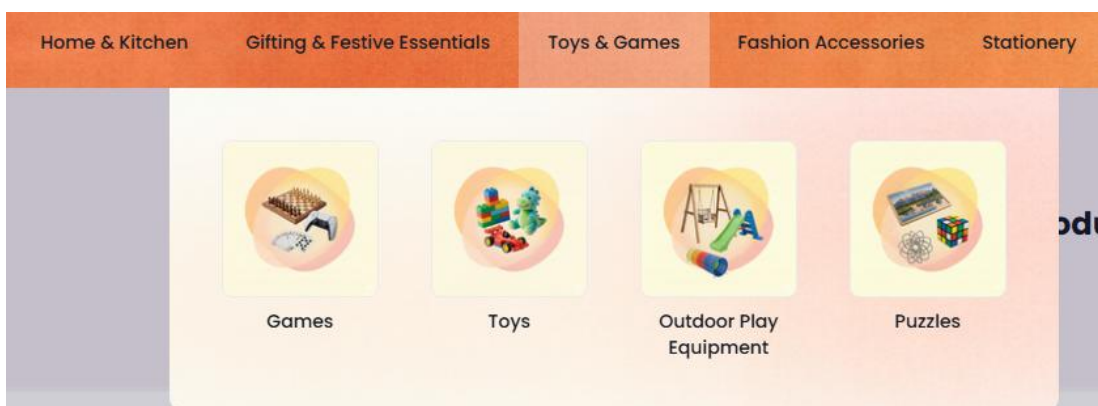

- Verify the latest live order. Fetch the name and the city of the person picked. Capture a screenshot as well.

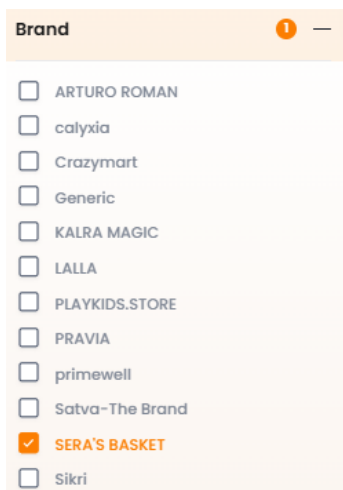

- Click on View All link in the Just Bargained Product section and identify the cheapest product among the most-bargained products.

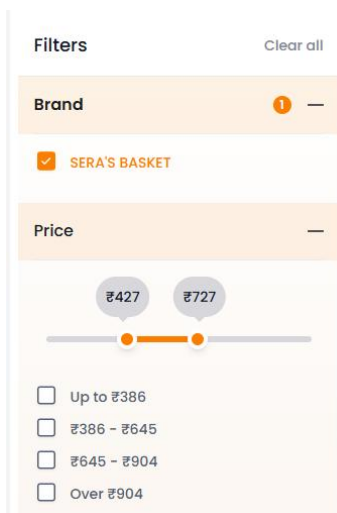

- Open the Toys & Games category tab.

12. Select **SERA'S BASKET** as the brand from the left filter.

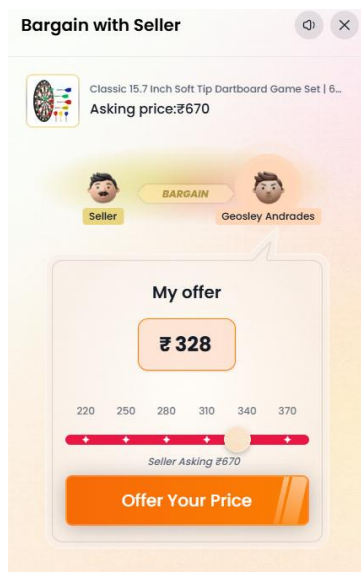

13. Set the price range from ₹427 to ₹727.

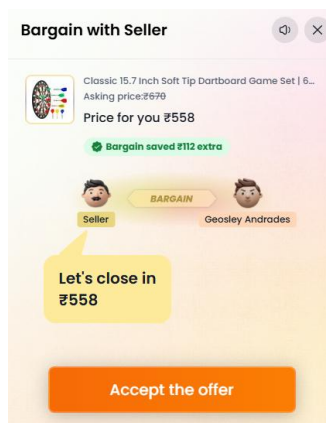

14. Select **Classic 15.7 Inch Soft Tip Dartboard Game Set**.

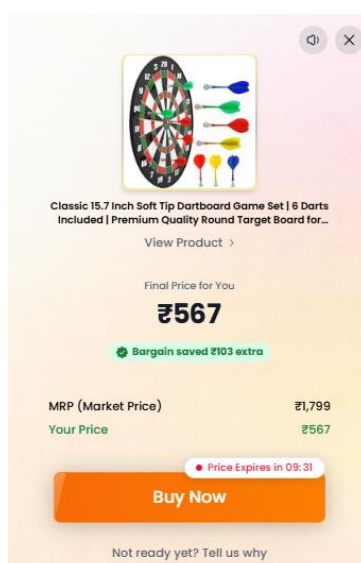

15. Click on the product and start bargaining.

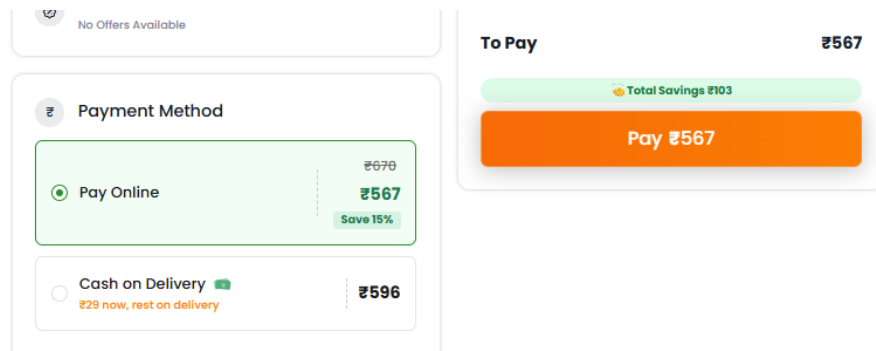

16. Keep Bargaining till 3 attempts. Accept the offer.

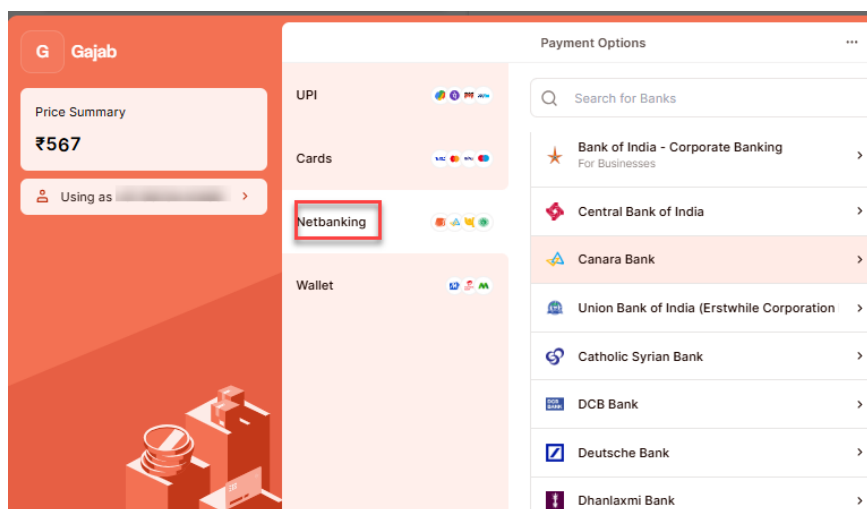

17. Click on By Now

18. Select payment method as “Pay Online” and Click on Pay.

19. Choose Net banking and select any bank

20. Click on Success button and confirm payment

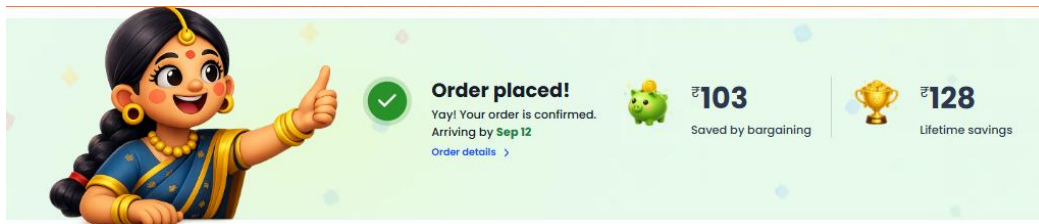

1

Welcome to Razorpay Software Private Ltd Bank

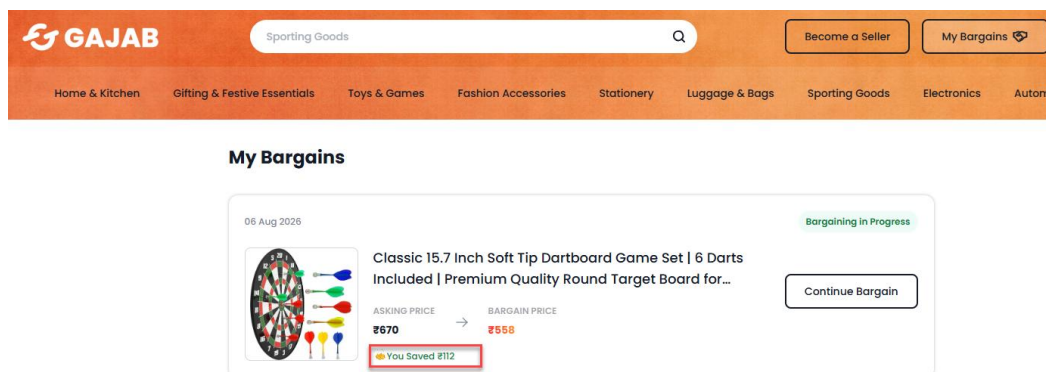

This is just a demo bank page.
You can choose whether to make this payment successful or not:

21. Verify your order has been placed.

22. Open My Bargains and verify the savings.

If a specified product, price, filter, or test dependency is unavailable during the event, teams must document the issue and demonstrate a reasonable fallback approach. Judges will consider the quality of the handling rather than penalizing teams for genuine environment limitations.

Automation Expectations

Teams should aim to demonstrate as many of the following capabilities as possible:

Framework Design

- A clean, modular, reusable, and maintainable framework
- Clear separation of test logic, test data, configuration, and page or component objects
- Parameterized scenarios
- Meaningful naming conventions and project structure
- Proper exception handling and recovery mechanisms
- Secure handling of OTPs, credentials, and environment configuration

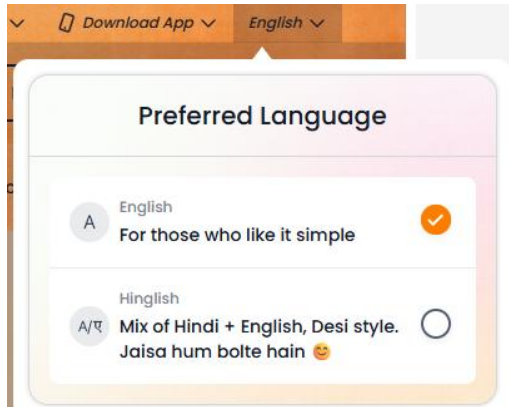

Test Data

- Test data sourced from an Excel file
- Externalized configuration and environment values
- Data-driven execution
- Support for both positive and negative datasets

Language Coverage

Execute the workflow in:

- English
- Hinglish

Browser Coverage

Demonstrate execution on:

- Google Chrome
- Mozilla Firefox
- Microsoft Edge

Device and Platform Coverage

Demonstrate or provide an executable approach for:

- Web
- Android

Your apk file can be downloaded from below link-

https://drive.google.com/file/d/1_3vz21k4VWJwfCNSHHW-IVkMpP7IarPe/view

(Please do not use production mobile app)

Simulators, emulators, device clouds, or equivalent approaches may be used. Teams must clearly identify which executions were completed and which were demonstrated through configuration or design.

Non-Functional Quality

Include relevant checks for:

- Accessibility
- Performance
- Security
- Visual regression or page comparison

The depth, relevance, and accuracy of these checks will matter more than the number of tools included.

Reporting and DevOps

The solution should include:

- Clear execution reports
- Screenshots or videos for important steps and failures
- Logs with useful diagnostic information
- Pass/fail summaries
- Defect or anomaly reporting
- CI/CD integration
- Instructions for local and pipeline execution

Source-Code Submission

Where the framework is not proprietary, teams should check the project into their GitHub profile and submit the repository link.

The submission will be reviewed by the judging panel and shared with the event's platform sponsor for evaluation purposes. Do not submit employer-owned, customer-owned, confidential, licensed, or proprietary code.

The repository should include:

- Source code
- README and setup instructions
- Dependency details
- Test-data template
- Execution commands
- Sample reports
- CI/CD configuration
- AI Usage Report
- Known limitations

Challenge 2: Bug Quest

The objective of the Bug Quest is to evaluate how effectively your team can understand the product, develop a risk-based testing approach, identify meaningful defects, and communicate findings to the product team.

Task 1: Create a Test Strategy

Create a test strategy for the application with the appropriate business and technical context.

The strategy should include:

- Product and user understanding
- Testing objectives
- Scope and out-of-scope areas
- Assumptions and dependencies
- Risk assessment
- User personas and critical journeys
- Functional test scenarios
- Negative and boundary scenarios
- Cross-browser and device coverage
- Accessibility considerations
- Performance considerations
- Security and privacy considerations
- Test-data requirements
- Entry and exit criteria
- Execution approach
- Prioritization methodology
- Known limitations

You are encouraged to use AI to develop or improve your strategy. Include the important prompts used and explain how the AI-generated recommendations were reviewed.

Task 2: Execute the Test Strategy

Use the strategy to perform your test run.

You may use:

- Exploratory testing
- Manual testing
- Your existing automation framework
- Newly created automation
- Browser development tools
- Accessibility tools
- Performance tools
- Security-testing tools
- AI-assisted testing tools

Teams should prioritize high-risk user journeys and areas that could affect revenue, trust, privacy, usability, conversion, or customer retention.

Task 3: Create a Bug Report

Build a clear, evidence-based bug report.

Each defect should ideally include:

- Unique defect ID
- Defect title
- Module or feature
- Environment
- Preconditions
- Steps to reproduce
- Expected result
- Actual result
- Severity
- Priority
- Business or user impact
- Reproducibility
- Supporting screenshot or video
- Console, network, or system evidence where relevant
- Suggested resolution, if appropriate

Greater weight will be given to valid defects with significant business or customer impact. The number of bugs alone will not determine the winner.

Duplicate, invalid, cosmetic-only, or poorly documented defects may receive limited or no credit.

Task 4: Share Product Feedback

Teams may also include Product feedback at the end of bug report:

- User-experience observations
- Product improvement ideas
- Feature recommendations
- Conversion improvements
- Accessibility recommendations
- Trust and safety improvements
- Suggestions for simplifying the bargaining or buying experience

Recommendations should be specific, evidence-based, and relevant to the product and its users.

General Rules

- Only work completed or submitted before the challenge period will be evaluated.
- All reported defects must be reproducible in the provided test environment.
- Do not test Gajab production website or attempt to access another user's information.
- Do not perform denial-of-service testing, uncontrolled load testing, data extraction, privilege escalation, or intrusive security testing on Gajab production or test environment.
- Use only authorized test accounts, mobile numbers, email addresses, and devices.
- Do not expose OTPs, credentials, personal information, API keys, or secrets in repositories, screenshots, reports, or AI prompts.
- Teams must comply with the application's testing instructions and event code of conduct.
- The judges' decisions will be final.

All the Best!
